

CE Marking – Dry Fix Range

To whom it concerns,

From the 1st July 2013 under the Construction Products Regulation (CPR) over 400+ Building Products were required to carry the CE mark covering a broad range of construction products. Numerous roofing products including but not limited to Roof Coverings, certain waterproofing products, roof windows and upstands are covered under the legislation. NWA offer over 1000 products to the market so the situation with all our products is unique but see below some general information on same.

North West Aluminium's Dry Fix range do not require a CE Certification, nor can they have one generated for them, as they are not covered by a harmonised European standard (hEN) All our Dry Fix range is tested to BS8612 and meet the requirement of BS5534 where applicable. This range of products is generally covered by a material and colour guarantee.

NWA also offer a range of rainwater systems to the market. They cannot be CE marked either for the reasons outlined above. All our rainwater products meet the required British Standards for Aluminium Rainwater systems. This range of products is covered by a material and colour guarantee.

NWA welcomes the introduction of improved testing, certification and oversight of construction products. NWA look forward to being able to provide a CE mark in the future with all our products along with any necessary testing due to the quality of our products. Details on specific products can be obtained as required.
